

APPLICATION OF SARVAM AI -PART 1

PRODUCT VISION DOCUMENT

THE MARKET GAP

- Voice technology is becoming popular because people can speak instead of typing. However, most voice-typing tools are designed mainly for English and do not understand Indian languages or mixed Hindi-English speech very well. This is a big problem for Indian users because they often switch between Hindi and English while working on apps like Word, Excel. This creates an opportunity for a voice tool that is built specifically for how Indian people naturally speak and work

WHAT KIVI SHOULD MEAN IN A PERSON'S LIFE?

- Kivi should be the fastest path from a thought to text, in whatever language that thought naturally arrives in. Not a transcription utility bolted onto one app, but the default way someone gets words onto a screen — email, WhatsApp, Word anywhere — without ever opening a separate window or thinking about which app supports which language.

WHOM IT SHOULD BELONG TO?

- Kivi belongs to people who speak more fluently than they type: Indian professionals, officials, and knowledge workers who are comfortable in Hindi or a regional language but lose time and precision typing it, or who constantly code-switch between English and their own language within a single sentence. It is not primarily for English monolingual users chasing customization depth — that market is already served, by Superwhisper and MacWhisper

WHERE IT CREATES VALUE THAT OTHER PRODUCTS DO NOT?

- Kivi has three main advantages that other tools do not have together. First, it understands Indian languages really well, including Hindi-English mixed speech.
- Second, it works inside almost any app on your computer, so you can use your voice anywhere.
- Third, it is very easy to use — just press one key and start speaking, without changing modes or going through settings. Superwhisper gives users many customization options, but this also makes it more complicated to set up. MacWhisper focuses on privacy and simple payment, but it has fewer language options and works in fewer places. Kivi's main advantage is simple: it understands Indian languages deeply, works everywhere, and requires almost no setup on an English dictation tool with Indian languages added later.

WHY SOMEONE WOULD CHOOSE TO KEEP IT.

- People will keep using Kivi if it becomes so useful that they don't even think about using it. If Kivi is faster and more accurate than typing, especially for Hindi and mixed Hindi-English speech, people will naturally use it every day. The goal is not to make a cool demo; the goal is to make voice typing faster than using your keyboard every time. It should also work well when there is noise around you or when you speak long sentences with pauses

WHAT IT MUST REFUSE TO BECOME?

- Kivi must refuse to become an English-first product with Indian languages as a secondary mode
- “Yaar, can you send the report aaj? We need it before 5.”
- An English-first tool might struggle with the Hindi “Yaar” and “aaj.” Code-switching is a known challenge for speech-to-text systems where the competitors lack and kivi wins
