

Kivi — Styles Redesign

Interactive prototype: <https://kivistyles.vercel.app/>

1. Prototype

Live interactive prototype: <https://kivistyles.vercel.app/>

The prototype is built around the idea: “Styles ”

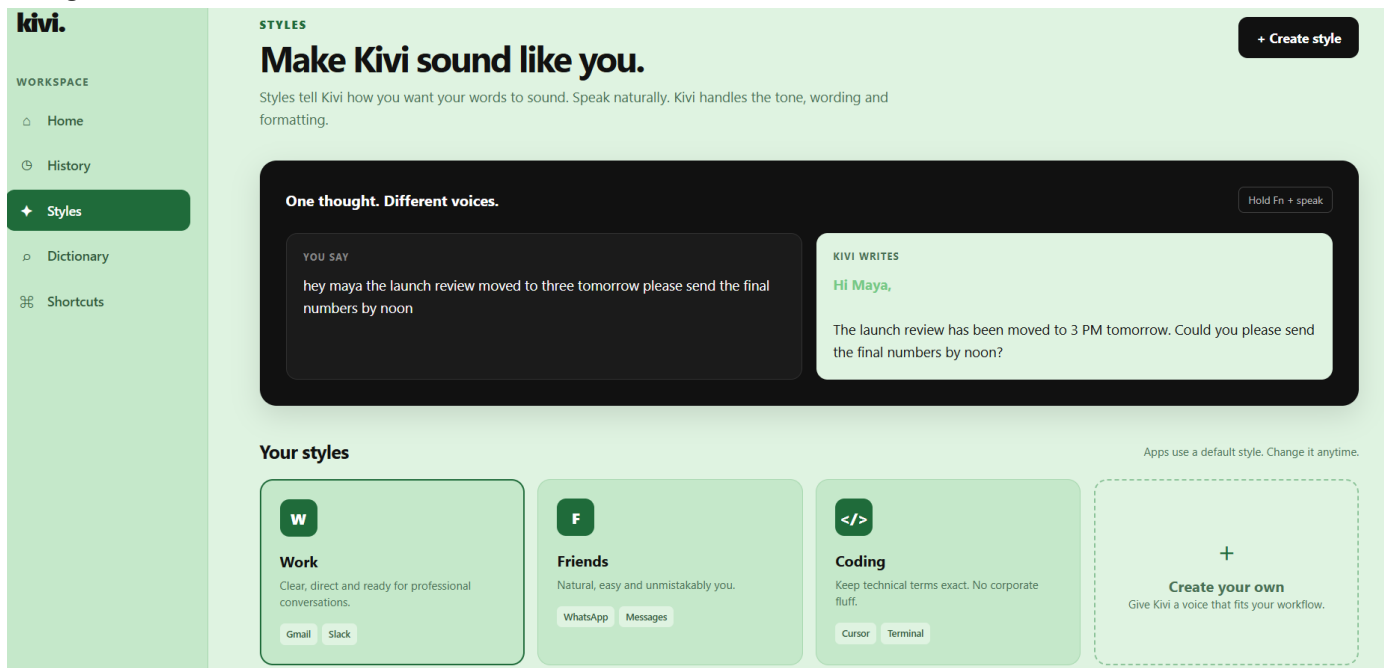

2. Screen reference

Screen 1 — Create a Style

Lets the user create a style, select the apps where it should be the default, choose a tone, and add custom instructions.

Before version- was simple but when me as user I was using AI and hit and trial method on how it actually works there were questions in my mind like

- Do I need to always open the kivi If need to make it professional when I want to write mail
- took time to find that I need to add the apps
- Didn't understood how work messaging is different from emails
- If I want to add a default app in each section because in general I use it 90% of the time and rest 10% I want to change

- Here there is one example of how if speak and what kivi does
- Different sections with default apps

- If something I need to create myself
- Named section with more understandable way so that user understand easily

Screen 2— Save / Interaction States

Shows the interaction and completion states involved in configuring and saving a style.

Style name

Input example: Work, Friends, Coding

Where should Kivi use it?

Gmail, WhatsApp, Slack, Messages, Cursor, Notes. Selected apps become the default style for those apps.

How should it sound?

Professional — Conventional and to the point.

Friendly — Warm without being too casual.

Casual — Natural, relaxed and conversational.

Your instructions

Example: Keep my messages clear and concise. Don't use complicated words.

Hints: Keep my Hinglish; Use short sentences; Don't add emojis; Always use bullet points.

Preview

You say: hey anika the meeting moved to tomorrow at five can you send me the numbers before then

Kivi writes: Hi Anika,

The meeting has been moved to tomorrow at 5 PM. Could you please send me the numbers before then?

Screen 3-What if whatsapp used for friends and work

Reference material describing the prototype flow and intended interaction model.

Change it only for ONE message — Context Override

Suppose:

WhatsApp → Friends is your default.

You're talking to a friend, so normally:

Press Fn → speak → Kivi uses Friends.

But suddenly you need to send a professional message to your professor.

You **don't go back to Styles settings**.

Instead:

Press Fn and say:

"Hey Kivi, make it professional."

Then speak:

"I wanted to check if we could reschedule the meeting to tomorrow."

3.How things work a mindmap is given at bottom

Gmail

Slack

Message app

Message

Cursor

Terminal

1

Choose a style
friends, coding or something else.

2

Choose your apps
Give each app a default style that fits how you normally use it.

3

Speak naturally
Don't think about punctuation, formatting or perfect wording.

4

Override when needed
Change the style for one message when the context is different.

Kivi learns how you speak.
Your styles make it sound like you.

Set it once. Speak naturally.
